Rent-A-Ride with Axon Ev

By Yash Tambade

Problem Statement

- Electric vehicles are becoming popular, but many users face problems when choosing an EV.
- Buying an EV requires a **high upfront cost**.
- Users find it difficult to **compare different EV models and specifications**.
- It is also hard to **estimate the monthly subscription cost** for EV plans.
- Therefore, a platform is required where users can **explore EVs, compare vehicles, and calculate subscription cost easily also rent car easily**.

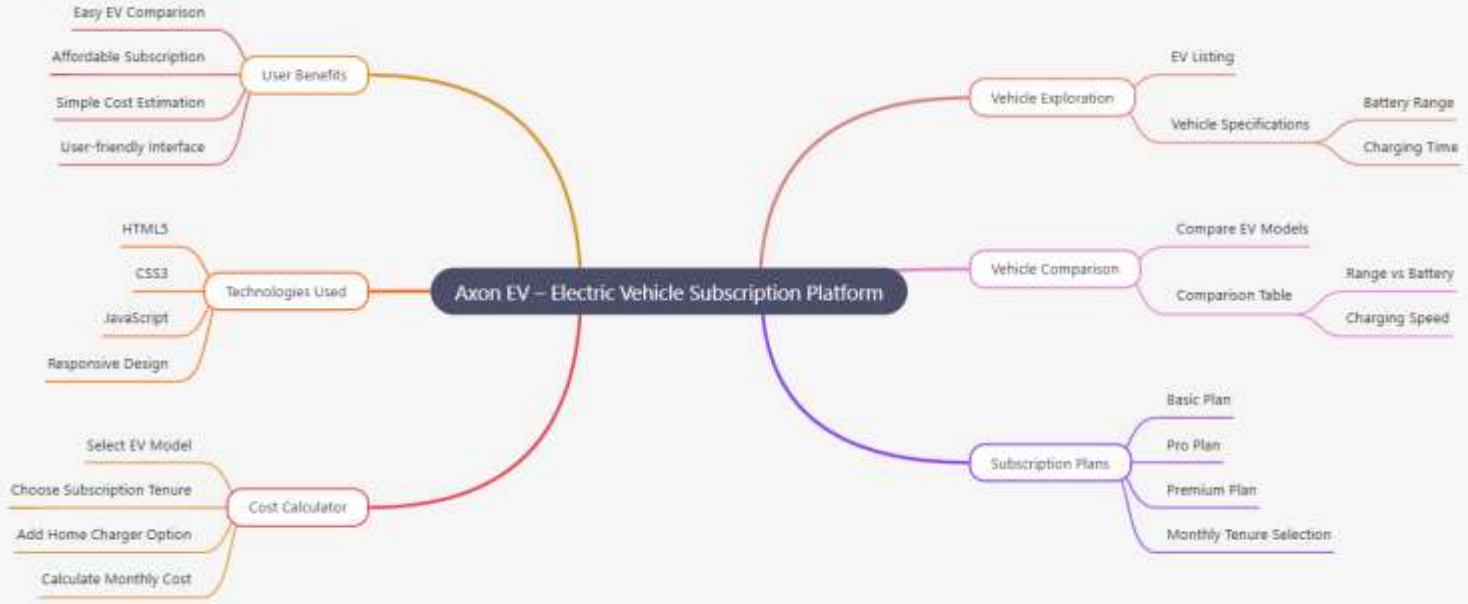
Solution (Axon EV)

To solve this problem, we developed **Axon EV**, an EV subscription platform.

- **Key Features:**
- EV **vehicle listing page**
- **Vehicle comparison table**
- **Subscription plan selection**
- **EV subscription cost calculator**
- Option to add **home charger add-ons**
- **Responsive website** built using HTML, CSS, and JavaScript
- This platform helps users **compare EVs and estimate subscription costs easily**.

Responsive website built using HTML, CSS, and JavaScript This platform helps users **compare EVs and estimate subscription costs easily**.

Working (Method/Mind map)



This mind map shows the working structure of the **Axon EV electric vehicle subscription platform**. It includes vehicle exploration, vehicle comparison, subscription plans, and a cost calculator. Users can browse EV models, compare specifications, select subscription plans, and estimate the monthly subscription cost. The platform is developed using **HTML5, CSS3, and JavaScript** to provide a simple and user-friendly experience.

Conclusion

•Axon EV simplifies the process of **exploring and comparing electric vehicles**.

•It helps users **estimate subscription costs quickly**.

•The platform demonstrates practical implementation of **HTML, CSS, and JavaScript**.

•This project provides a **user-friendly EV subscription solution**.
